

Quick Overview

As electric current flows through wire, there is a loss in voltage. This loss is referred to as IR voltage drop.
 Voltage (Drop) = Wire Resistance X Amps of current (E=IR)

Calculating the voltage drop for a pair of wires gets a little tricky, so we've built a quick lookup chart for the wire size you'll need for your application. The table below is for 12 volt AC or DC devices only. You just need to know the wattage (VA) or amps and the chart will show you how far you can go in feet for any pair of wire sizes listed. The chart is based on a 10% voltage loss on a pair of wires. This should work for most 12 volt devices. Checking the manufacturer's specifications, use the maximum watts or current and make sure the minimum operating voltage is 10V or less. The yardage in the chart is linear, a loss of 20% would double the distance, or 5% would halve it. Table calculations are based on wire ohms at 70°F. If the wire temperature is raised to 130°F, the voltage drop will increase by approximately 3%. Voltage drop calculations are also based on a conventional load. If the manufacturer makes recommendations for wire sizes, use them instead of this chart.

Wire Length Table

12V Power Required W(VA)/Amps	The recommended maximum distances for 12volts, ac or dc, is the cell below the wire size, adjacent to watts (VA) or required current.

Quick Overview

As electric current flows through wire, there is a loss in voltage. This loss is referred to as IR voltage drop.
 Voltage (Drop) = Wire Resistance X Amps of current (E=IR)

Calculating the voltage drop for a pair of wires gets a little tricky, so we've built a quick lookup chart for the wire size you'll need for your application. The table below is for 24 volt AC or DC devices only. You just need to know the wattage (VA) or amps and the chart will show you how far you can go in feet for any pair of wire sizes listed. The chart is based on a 10% voltage loss on a pair of wires. This should work for most 24 volt devices. Checking the manufacturer's specifications, use the maximum watts or current and make sure the minimum operating voltage is 21.6V or less. The yardage in the chart is linear, a loss of 20% would double the distance, or 5% would halve it. Table calculations are based on wire ohms at 70°F. If the wire temperature is raised to 130°F, the voltage drop will increase by approximately 3%. Voltage drop calculations are also based on a conventional load. If the manufacturer makes recommendations for wire sizes, use them instead of this chart.
